April 2008

New SuperCharge Silver Maintenance-Free Battery is a Cut above the Rest

SuperCharge Batteries launched a new addition in its broad range of product line-up, SuperCharge Silver Maintenance Free Battery.

Compared to other competing batteries, Supercharge Silver is powered by EXG Technology – an advanced, fully automated Manufacturing process that produces expanded calcium grids. This technology

is adopted by the world's leading battery manufacturers worldwide.

SuperCharge Silver calcium grids have a more compact grain structure and are inherently stronger unlike with ordinary gravity-castled grids batteries. This feature makes it less prone to heat and corrosion, two main causes of battery failure, and ensures more efficient current conductivity resulting to superior performance ratings.

There is no need to top up as SuperCharge Silver is guaranteed Maintenance Free. The strong chemical composition of its EXG calcium plates significantly reduces water loss and prolongs battery shelf and service life. Conversely, batteries using antiquated hybrid antimony or ordinary calcium grids would need to have a constant access through the vent caps to top up the acid and water levels. Since these batteries do not provide the same power and service life that SuperCharge Silver expanded grid battery can offer without endangering the battery from acid depletion, their specification rating and guarantee periods are in most cases way much lower.

SuperCharge Silver MF battery is offered with as much as 24 months nationwide full replacement warranty.
